## **ABSTRACT**

The paper looks at some of the factors, issues, and new opportunities when using control products for the optimum care of sports turf. Syngenta Professional Products are developing a new range of application techniques and customised nozzles to obtain the best performance from their range of control products. Recent Syngenta trials in conjunction with STRI, on new application techniques, including reduced water volumes, and purpose designed nozzles, have shown that while reducing the risk of environmental and bystander exposure associated with spray drift, there are opportunities for improved technical performance, and better timing of spray applications.
